3 Introduction

3.1 General safety instructions

DANGER

Warning concerning installation of the device and software

Installation of the device and the interface must be carried out by qualified personnel only. Qualified personnel meets the following requirements:

- You are familiar with the safety designs used in automation engineering, and understand how to deal with them in your capacity as configuration engineer.
- You are an operator of automation systems and have been instructed in how to handle the system. You are familiar with the operation of the equipment described in this documentation.
- You are a commissioning or service engineer and have successfully completed a training course qualifying you to repair automation systems. In addition you are authorized to commission, ground and label circuits and equipment in accordance with safety engineering standards.

Always observe the current safety and accident prevention regulations when commissioning the equipment.

Install automation engineering equipment and installations with sufficient protection against accidental actuation.

DANGER

Warning concerning use of the device

- Take suitable precautions in both the hardware and software to prevent any undefined states of the automation installation in the event of an open circuit.
- In installations where major damage to property or even personal injury may be caused by a malfunction, take suitable precautions to establish a safe operating state in the event of a fault. This may be achieved using limit switches, mechanical interlocks etc. for example.
- Do not make unauthorized modifications to the device or to the PROFINET interface.

NOTICE

- Install the power, signal and sensor cables so as to prevent electromagnetic interference from impairing operation of the equipment.
- Proper transportation, storage, installation and assembly plus careful operation and maintenance are essential for trouble-free and safe operation of the equipment.
- Have non-functional instruments inspected by the manufacturer.

3.2 Intended use

The DIGIFORCE® 9307 is an instrument for monitoring repetitive production processes. Its core function is to record and analyze signals from processes in which physical variables, such as force, pressure or torque, vary as a function of displacement, angle or time according to a defined curve. The resultant measurement curve is analyzed using graphical evaluation elements such as windows, envelopes and thresholds. The result of the analysis is classified as "OK" or "NOT OK" (NOK) and can be retrieved from various interfaces.

The instrument is not a substitute for a safety device; for instance it cannot be used as an emergency stop device in a press for when the pressure exceeds a set limit.

6 PROFINET

6.1 General information on PROFINET data transfer

For PROFINET (cyclic data traffic), one must define at the configuration stage how many bytes are transferred between Controller and Device during each cyclic access (GSD file).

The device is controlled using the data transferred from Controller to Device. This data always consists of four bytes for the DIGIFORCE® 9307 unit. The function of these four bytes is explained in chapter 8.2 PLC inputs – Transfer from controller to device.

The DIGIFORCE® 9307 sends cyclic 140 bytes to controller. This packet contains PLC status and evaluation information and 30 measurement values which are user selectable within the 9307 configuration and the live values of max. 3 active measurement channels.

6.2 GSD file

DIGIFORCE® equipment with the PROFINET option is supplied with a CD. This disk includes the device description file *GSDML-V2.31-BURSTER-DIGIFORCE-9307-20160329-155500.xml* (GSD file). This GSD file describes the physical properties of the device.

The structure, contents and encoding of this device description data is standardized so that any Profinet devices can be configured using configuration tools from various manufacturers.

The GSD file does not specify what data is transferred or how this data should be interpreted. The user must glean this information from the operating manual and program his Controller accordingly.

6.3 Data conversion

6.3.1 Description of the data formats in this manual

The terms PLC inputs and PLC outputs refer to the DIGIFORCE® 9307 unit. These terms are reversed when referred to the Controller.

The function of the PLC-In / PLC-Out bits is identical to the parallel PLC I/O ports on the unit itself and can be found in the DIGIFORCE® 9307 operating manual.

The floating-point numbers ("float") mentioned are four bytes long (32 bits) and are based on the IEEE-754 standard.

Numbers that are not specifically labeled or are labeled with "d" or "dec" are decimal numbers. (Example: 1234, 1234dec, dec1234, 1234d)

Numbers that are labeled with "0x" or "hex" are hexadecimal numbers. (Example: 0x1234, hex1234, 1234hex, 1234h)

Numbers that are labeled with "b" or "bin" are binary numbers. (Example: b1100, bin1100, 1100b, 1100bin).

6.3.2 Handling problems that arise when reading floating-point numbers

This only concerns cases in which floating-point numbers need to be read from the DIGIFORCE® 9307 unit.

Floating-point numbers (data type REAL), according to IEEE 754, are encoded as four bytes for transfer. This may create problems depending on the type of PLC used.

Cause

In the DIGIFORCE® 9311-PROFINET, the sign byte is transferred first if using acyclic data transfer and last while cyclic data transmission. Some PLCs expect this byte in the highest of the four addresses not in the lowest address. This inevitably leads to misinterpretation of the numeric value. In this case the order of the four bytes has to be changed by the PLC as shown in the figure.

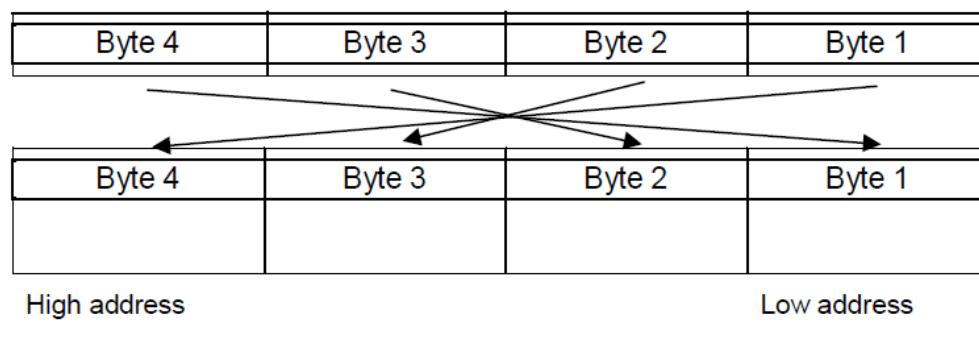

Diagram 2: Exchange of the order of bytes caused by misinterpretation of the numeric value

7 Alarms

The DIGIFORCE® 9307 supports two types of alarms: process alarms and diagnosis alarms. Currently two alarms are available. For the handling of alarms slot 200 is reserved.

Process Alarm: *Device Error* is sent if a measurement channel is overloaded or the device is not ready for the measurement.

Slot:	200
Subslot:	1
User structure identifier:	1
Alarm text:	Device error (e.g. measurement channel overload or device is not ready)
Alarm text length (Byte):	71

Diagnosis Alarm: *Overtemperature* is sent if the temperature inside of the device exceeds the critical level

Slot:	200
Subslot:	1
Channel error type:	5
Extended channel error type:	1

8 PROFINET data protocol

* The selectable list contains values which are defined within the DIGIFORCE® 9307 device. The following values are available:

- General curve data Y1
- General curve data Y2
- Evaluation results of mathematical functions
- Evaluation results of each evaluation element (e.g. window entry/exit window extended evaluation results like Min/Max window limits Xmin, Xmax, Ymin, Ymax threshold crossing point.)

¹ The live values of the sensor channels are updated at a rate of 100 Hz. The values are only updated when the DIGIFORCE® 9307 is ready to record measurements or is actively taking a measurement.

How to define the selectable list: The parameterization of the selectable lists is done in the main setup menu "Setup user defined values" (Note that this setting is specific for each measurement program. For details refer to the DIGIFORCE® 9307 operation manual, section 5.13 User defined values.)

8.2 PLC inputs – Transfer from controller to device

Four bytes of PLC-In data for the DIGIFORCE® 9307 are always transferred from the PROFINET Controller to the DIGIFORCE® 9307. These bits have the same function as the parallel PLC inputs to the DIGIFORCE® 9307 unit. (See detailed documentation of these signals within the DIGIFORCE® 9307 operation manual, section 4.4.1 PLC-Interface)

8.3 PLC outputs – Transfer from device to controller

The data refers to the PLC output of the DIGIFORCE® 9307. The data described here is the data transferred from the DIGIFORCE® 9307 to the PROFINET controller.

The function of the PLC-In / PLC-Out bits is identical to the parallel PLC I/O ports on the unit itself and can be found in the DIGIFORCE® 9307 operation manual for the unit. Also the signal timing is available within the DIGIFORCE® 9307 operation manual.

9 Acyclic PROFINET services

The services are described from the point of view of the controller.

Please Note: The subslot number has always to be set to 1.

The acyclic PROFINET services allow access to following DIGIFORCE® 9307 functions:

- Complete device configuration
- Transfer of component/worker/job data for logging
- Retrieval of large amounts of process and curve data

For further information and support for Siemens PLC integration please contact our service department at service@burster.com.

42	19 ... 54	<p>Comment on slots 19 ... 54: Reading these entries only makes sense if the data has been read from the sensor beforehand (indices 10, 11, 12). It is also possible to write sensor data here. A certain risk is hidden here: If data that is not appropriate for the sensor has been written, the results of the sensor measurements can no longer be read correctly! In cases of doubt, the data should not be written here manually, but should instead be read out of the sensor through indices 10/11/12. After all the sensor data for the channel concerned has been written, they still have to be transferred into the device through a write access to indices 55/56/57, and then adopted by the device's internal FPGA through write access to indices 16/17/18.</p>

9.2.33 Read-out curve coordinates of current measurement curve with single array access

Note that there are two different ways to read the coordinates of the measurement curve:

- Read complete coordinates with a single array access (Array size up to 20 KB)
- Read unique coordinates in several coordinate groups of up to 200 coordinates each

Sequence to read the complete curve coordinates

- 1 Load the curve into the field bus controller through a write access to index 10.
- 2 Query the index of the last measured value of the curve (→ end of the curve) through a read access to index 10 to know the size of the complete curve array (size = index +1).
- 3 Read the complete coordinate-array with access to index 11 (Array size up to 5000 float values = 20 KB).

Note: Please note that you have to announce the length of the buffer to write the curve coordinates to PLC side buffer. Maximum buffer size required to store 5.000 float coordinates is 20.000 bytes. The device will not send more bytes than you have announced.

Sequence to read the unique curve coordinates

- 1 Load the curve into the field bus controller through a write access to index 10.
- 2 Query the index of the last measured value of the curve (→ end of the curve) through a read access to index 10 to know the size of the complete curve array.
- 3 The curve can now be read out in coordinate groups of up to 200 coordinates each:
Coordinate group 0: Measured value 0 ... 199
Coordinate group 1: Measured value 200 ... 399
Coordinate group 2: Measured value 400 ... 599 ... etc.
- 4 The number of the desired coordinate group is entered through a write access to index 19.
Since you want to read the beginning of the curve, enter a 0.

It is now possible to read the coordinate values no. 0 ... 199 (at present you have selected coordinate group 0) at the indices 20 ... 219.

- 5 To access the coordinate group 1 (values 200 ... 399) write 1 to index 19.
It is now possible to read curve values no. 200 ... 399 at indices 20 ... 219.
- 6 Follow the same way to read the further coordinate groups.
- 7 Only coordinate values that are smaller than or equal to the number of the last measured value (which was read at index 10) may be read out.
