

## **Tension and Compression Load Cell**

## **MODEL 8523**

# burster TEDS

High ranges

With load buttons

With pull plates + rod end bearings

### **Highlights**

- Measuring ranges from 0 ... 20 N to 0 ... 5 kN,
  0 ... 4.4 lbs up to 0 ... 1.1 klbs
- Tilt-free installation thanks to point-contact mounts
- Excellent price/performance ratio
- Easy mounting

#### **Options**

- Pull plate for directing tension forces
- Load buttons for simple measurement of compressive loads
- Standardized output signal
- burster TEDS

## **Applications**

- Machine tools
- Reference sensor for comparative measurements
- All forms of test benches
- R&D

#### **Product description**

The tension & compression load cells from the 8523 series are designed for a wide range of uses. The sensors feature many benefits, including three point-contact mounts for tilt-free installation. Thanks to this feature, excellent measurement results can be achieved even with a sub-optimum mounting surface.

The force to be measured is applied to the central threaded hole in the tension or compression direction. For measuring purely compressive loads, using load buttons from our accessories range saves the need for complex sensor-integration mechanisms. Tensile loads in rods or chains can also be detected with ease using the optional pull plate.

Inside the sensor is an elastic membrane, on which are applied strain gages connected in a full Wheatstone bridge. If a tensile or compressive load is applied to the sensor, the ohmic resistance of the measuring bridge changes and detunes the output signal in proportion to the measured load in mV/V.

## **Electrical termination**

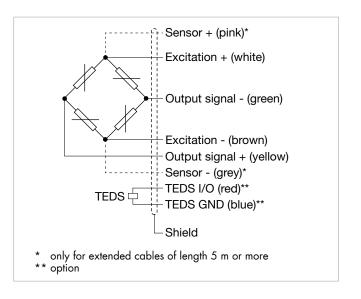

## **Output signal**

burster load cells are based on a strain-gage Wheatstone bridge. This measurement principle means that the output voltage mV/V is highly dependent on the sensor supply voltage. Our website contains details of suitable instrumentation amplifiers, indicator and display devices and process instruments.

## burster TEDS

The "burster Transducer Electronic Data Sheet" (TEDS) is a memory in which identification data of the sensor, calibration data and other sensor parameters are saved. In conjunction with your own suitable burster device, there is the option of performing a simple adjustment in order to achieve the maximum accuracy of the measuring chain. A simple sensor exchange is thus possible in just a few steps without losing precision.

## **Options**

## **Pull plates**

A pull plate extends the range of potential uses of tension & compression load cells to measuring tensile loads in moving assemblies (cable tension or forces in joints). The pull plate is fastened by its outer flange to the sensor's flange. Customized threaded parts or even joint lugs can be fitted in the central threaded hole. Once fitted, the pull plates form part of the sensor. Sensor and plate are calibrated as a unit and are supplied only as a pre-assembled combination. Bolts of strength 12.9 are required for fitting the pull plates.

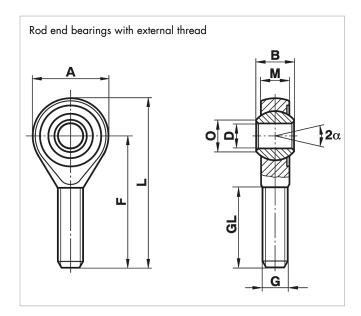

Order number		see order code

#### Rod end bearings

The 8523 load cell can be optionally supplied with a rod end bearing. In combination with a pull plate (see option), up to two rod end bearings can be used. Rod end bearings ensure optimum load application when the sensor is used in the tension direction. In addition, they can compensate for slight misalignment in the compression direction.

- Optimal force introduction
- Compensation of misalignments
- Very high dynamic und static load capacity
- Material: stainless steel
- Temperature range: 45 °C to + 120 °C
- PTFE insert, maintenance-free
- DIN 648 series K
- Bore holes H7, recommended connection pin: g6
- Inner ring not suitable for permanent rotary operation

## **Accessories**

## Load buttons

Load buttons are used when purely compressive forces are meant to be applied to the load cell and when direct coupling to the surrounding mechanical structure via the central threaded hole in the sensor is not required/possible. The domed surface of the load button minimizes angle errors for loads applied at an angle of up to  $3^{\circ}$ . The compressive force must be applied to the button via a flat and hardened contact surface. The optimum hardness is 60 HRC or more.

## **Connectors and units**

## **Order Code**

Connectors	
9941	Connectors 12 pin, suitable to all burster desktop units
9900-V209	Connectors 9 pin, suitable to SENSORMASTER, DIGIFORCE® and TRANS CAL
9900-V229	Connectors 9 pin with TEDS
9900-V245	Connectors 8 pin, suitable to ForceMaster
Units	
7281-V0001	Mobile measuring device with strain gage simulator and sensor test (R <sub>i</sub> , R <sub>a</sub> , Shunt, R <sub>ISO</sub> )
refer to section 9	Sensor electronics, amplifier and process control units like digital indicator model 9180, model 9163, modular amplifier model 9250 or DIGIFORCE® model 9307

## **Calibration**

Test and calibration	Test and calibration certificate						
Supplied with the sensor	Amongst other data, includes figures for zero point, full-scale output and calibration offset						
Standard factory cal	bration certificate for load cells or measurement chains (WKS)						
Optionally available	Our standard factory calibration is performed in 20% steps starting from zero until the reaching the nominal force, for increasing and decreasing load with unchanged installation position. Factory calibration can be performed in compression and/or tension direction.						
Special factory calib	ration certificate for load cells or measurement chains (WKS)						
On request	We are happy to calibrate sensors and measurement chains to the customer's specification.						
Calibration certificat	e with accreditation symbol for product group load cell 8523						
Optionally available	Calibration certificate with accreditation symbol for load cells 8523. Calibration is performed on the basis of the accreditation of the calibration laboratory D-K-15141-01-00, for the scope of accreditation listed in the annex to the certificate. The traceability to national standards as well as a wide international recognition (DAkkS as signatory of the Multilateral Agreements of EA, ILAC and IAF) are thus guaranteed. Calibration is performed according to ISO 376 in 10 force steps (10% steps) vstarting from zero until the reaching the nominal force, for increasing and decreasing load under various installation positions.
